## **Description of the objects and their features used for the graphical view of a restaurant**

In SketchUp, I designed a lovely seaside restaurant using lots of helpful tools. I used drawing and modeling tools to create the restaurant's layout, adding things like roofs, tables, and fences. SketchUp has a big collection of ready-made objects that I used to decorate the restaurant, like vases, summer huts, plates, and tushes packs. I also added some 3D textures to make things look more realistic and shadows to give depth to the scene. I made some parts of the restaurant interactive, so they could change depending on what I wanted. I also added extra features using extensions, which are like bonus tools. These tools helped me make the restaurant look even better with fancy styles and effects. With SketchUp, I could make detailed plans and presentations easily, so everyone could understand my ideas clearly. Overall, SketchUp made it easy for me to create a beautiful seaside restaurant that everyone would enjoy visiting.
